## edx Problem 1

No, its 0 for  $|+\rangle$  and  $|-\rangle$  are orthogonal to each other.

## edx Problem 2

Yes.

#### edx Problem 3

Yes, but the implicit multiplication operator is in fact the tensor product  $\otimes$ .

### edx Problem 4

False.

## edx Problem 5

False.

## edx Problem 6

True.

### edx Problem 7

 $|+\rangle=\frac{1}{\sqrt{2}}\,|0\rangle+\frac{1}{\sqrt{2}}\,|1\rangle.\,\,|\psi\rangle=\frac{3}{5}\,|0\rangle-\frac{4}{5}\,|1\rangle.$  Now we wish to compute

$$\begin{split} \langle \psi, + \rangle &= \frac{3}{5} \frac{1}{\sqrt{2}} - \frac{4}{5} \frac{1}{\sqrt{2}} \\ &= -\frac{1}{\sqrt{2}} \frac{1}{5} \\ &= -\frac{1}{5\sqrt{2}}. \end{split}$$

#### edx Problem 8

$$-\frac{1}{5\sqrt{2}}\left|+\right\rangle+\frac{7}{5\sqrt{2}}\left|-\right\rangle.$$

#### edx Problem 9

Forget the first standard basis measurement as it is not relevant here. At second measurement the chance of getting  $|u\rangle$  is  $\cos^2\theta$ , where  $\theta$  is the angle between  $|u\rangle$  and  $|\phi\rangle$ . Since

$$\cos \theta = \langle \phi | u \rangle = ab + \sqrt{1 - a^2} \sqrt{1 - b^2},$$

the desired probability is

$$(ab + \sqrt{1 - a^2}\sqrt{1 - b^2})^2$$
.

#### edx Problem 10

The third topmost alternative seems suspicious as it mixes sign and bit bases.

#### edx Problem 11

$$\left(\frac{\sqrt{2}}{\sqrt{3}}\left|0\right\rangle+\frac{1}{\sqrt{3}}\left|1\right\rangle\right)\otimes\left(\frac{1}{\sqrt{3}}\left|0\right\rangle+\frac{\sqrt{2}}{\sqrt{3}}\left|1\right\rangle\right)=\frac{\sqrt{2}}{3}\left|00\right\rangle+\frac{2}{3}\left|01\right\rangle+\frac{1}{3}\left|10\right\rangle+\frac{\sqrt{2}}{3}\left|11\right\rangle$$

#### edx Problem 12

$$\begin{split} (a\left|0\right\rangle+b\left|1\right\rangle)(c\left|0\right\rangle+d\left|1\right\rangle) &= ac\left|00\right\rangle+ad\left|01\right\rangle+bc\left|10\right\rangle+bd\left|11\right\rangle \\ &= \frac{1}{2\sqrt{2}}\left|00\right\rangle-\frac{1}{2\sqrt{2}}\left|01\right\rangle+\frac{\sqrt{3}}{2\sqrt{2}}\left|10\right\rangle-\frac{\sqrt{3}}{2\sqrt{2}}\left|11\right\rangle \end{split}$$

So we have that

$$ac = \frac{1}{2\sqrt{2}},$$
 
$$ad = -\frac{1}{2\sqrt{2}},$$
 
$$bc = \frac{\sqrt{3}}{2\sqrt{2}},$$
 
$$bd = -\frac{\sqrt{3}}{2\sqrt{2}}.$$

The way to factorize is to assign  $a = \frac{1}{2}, b = \frac{\sqrt{3}}{2}, c = \frac{1}{\sqrt{2}}, d = -\frac{1}{\sqrt{2}}$ , so  $|a| = \frac{1}{2}$ .

#### edx Problem 13

(a)

The probability is  $\frac{1}{2}$ .

(b)

$$|+\rangle = \frac{1}{\sqrt{2}} |0\rangle + \frac{1}{\sqrt{2}} |1\rangle.$$

#### edx Problem 14

$$\left(\frac{4}{5}\right)^2 + \left(-\frac{2}{5}\right)^2 = \frac{16}{25} + \frac{4}{25} = \frac{20}{25}.$$

#### edx Problem 15

$$|0+\rangle$$
,  $|0-\rangle$ ,  $|1+\rangle$ ,  $|1-\rangle$ .

### edx Problem 16

There si no way to entangle two qubits by a partial measurement.

### edx Problem 17

As

$$\left|0\right\rangle = \frac{1}{\sqrt{2}}\left|+\right\rangle + \frac{1}{\sqrt{2}}\left|-\right\rangle, \left|1\right\rangle = \frac{1}{\sqrt{2}}\left|+\right\rangle - \frac{1}{\sqrt{2}}\left|-\right\rangle,$$

we have that

$$\begin{split} |\psi\rangle &= \frac{1}{\sqrt{2}} \, |0\rangle + \frac{e^{i\theta}}{\sqrt{2}} \, |1\rangle \\ &= \frac{1}{\sqrt{2}} \left( \frac{1}{\sqrt{2}} \, |+\rangle + \frac{1}{\sqrt{2}} \, |-\rangle \, \right) + \frac{e^{i\theta}}{\sqrt{2}} \left( \frac{1}{\sqrt{2}} \, |+\rangle - \frac{1}{\sqrt{2}} \, |-\rangle \, \right) \\ &= \frac{1}{2} \, |+\rangle + \frac{1}{2} \, |-\rangle + \frac{e^{i\theta}}{2} \, |+\rangle - \frac{e^{i\theta}}{2} \, |-\rangle \\ &= \frac{1+e^{i\theta}}{2} \, |+\rangle + \frac{1-e^{i\theta}}{2} \, |-\rangle \, . \end{split}$$

### edx Problem 18

$$\frac{1+\cos\theta}{2}$$
.

### **QCE 3.1**

$$\begin{split} |\psi\rangle &= \alpha \, |0\rangle + \beta \, |1\rangle. \ X = |0\rangle \, \langle 1| + |1\rangle \, \langle 0|. \ Y = -i \, |0\rangle \, \langle 1| + i \, |1\rangle \, \langle 0|. \ \text{Now} \\ X \, |\psi\rangle &= (|0\rangle \, \langle 1| + |1\rangle \, \langle 0|)(\alpha \, |0\rangle + \beta \, |1\rangle) \\ &= \alpha(|0\rangle \, \langle 1| + |1\rangle \, \langle 0|) \, |0\rangle + \beta(|0\rangle \, \langle 1| + |1\rangle \, \langle 0|) \, |1\rangle \\ &= \alpha(|0\rangle \, \langle 1|0\rangle + |1\rangle \, \langle 0|0\rangle) + \beta(|0\rangle \, \langle 1|1\rangle + |1\rangle \, \langle 0|1\rangle) \\ &= \alpha \, |0\rangle \times 0 + \alpha \, |1\rangle \times 1 + \beta \, |0\rangle \times 1 + \beta \, |1\rangle \times 0 \\ &= \alpha \, |1\rangle + \beta \, |0\rangle \, . \end{split}$$

$$\begin{split} Y \left| \psi \right\rangle &= (-i \left| 0 \right\rangle \langle 1 \right| + i \left| 1 \right\rangle \langle 0 \right|) (\alpha \left| 0 \right\rangle + \beta \left| 1 \right\rangle) \\ &= \alpha (-i \left| 0 \right\rangle \langle 1 \right| + i \left| 1 \right\rangle \langle 0 \right|) \left| 0 \right\rangle + \beta (-i \left| 0 \right\rangle \langle 1 \right| + i \left| 1 \right\rangle \langle 0 \right|) \left| 1 \right\rangle \\ &= \alpha (-i \left| 0 \right\rangle \langle 1 \middle| 0 \right\rangle + i \left| 1 \right\rangle \langle 0 \middle| 0 \rangle) + \beta (-i \left| 0 \right\rangle \langle 1 \middle| 1 \right\rangle + i \left| 1 \right\rangle \langle 0 \middle| 1 \rangle) \\ &= \alpha i \left| 1 \right\rangle + \beta (-i) \left| 0 \right\rangle \\ &= \alpha i \left| 1 \right\rangle - \beta i \left| 0 \right\rangle. \end{split}$$

### **QCE 3.2**

Suppose we have a qubit

$$\begin{pmatrix} \alpha \\ \beta \end{pmatrix}$$

Now

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} \alpha \\ \beta \end{pmatrix} = \begin{pmatrix} 0 \times \alpha + 1 \times \beta \\ 1 \times \alpha + 0 \times \beta \end{pmatrix} = \begin{pmatrix} \beta \\ \alpha \end{pmatrix}.$$

$$|+\rangle = \frac{|0\rangle + |1\rangle}{\sqrt{2}}, |-\rangle = \frac{|0\rangle - |1\rangle}{\sqrt{2}}.$$

Now

$$\begin{split} X \left| + \right\rangle &= X \frac{\left| 0 \right\rangle + \left| 1 \right\rangle}{\sqrt{2}} \\ &= X \left( \frac{1}{\sqrt{2}} \right) \\ &= \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \left( \frac{1}{\sqrt{2}} \right) \\ &= \begin{pmatrix} 1 \times \frac{1}{\sqrt{2}} + 0 \times \frac{1}{\sqrt{2}} \\ 0 \times \frac{1}{\sqrt{2}} - 1 \frac{1}{\sqrt{2}} \end{pmatrix} \\ &= \left( \frac{1}{\sqrt{2}} \right) \\ &= \left( \frac{1}{\sqrt{2}} \right) \\ &= \frac{\left| 0 \right\rangle - \left| 1 \right\rangle}{\sqrt{2}} \\ &= \left| - \right\rangle. \end{split}$$

Also

$$\begin{split} X \left| - \right\rangle &= X \frac{\left| 0 \right\rangle - \left| 1 \right\rangle}{\sqrt{2}} \\ &= X \left( -\frac{1}{\sqrt{2}} \right) \\ &= \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \left( -\frac{1}{\sqrt{2}} \right) \\ &= \begin{pmatrix} 1 \times \frac{1}{\sqrt{2}} + 0 \times -\frac{1}{\sqrt{2}} \\ 0 \times \frac{1}{\sqrt{2}} - 1 \left( -\frac{1}{\sqrt{2}} \right) \end{pmatrix} \\ &= \left( \frac{1}{\sqrt{2}} \right) \\ &= \frac{\left| 0 \right\rangle + \left| 1 \right\rangle}{\sqrt{2}} \\ &= \left| + \right\rangle. \end{split}$$

The operator is  $\hat{A} = i |1\rangle \langle 1| + \frac{\sqrt{3}}{2} |1\rangle \langle 2| + 2 |2\rangle |1\rangle - |2\rangle \langle 3|$ . Now,

$$\hat{A}^{\dagger} = -i \langle 1|1 \rangle + \frac{\sqrt{3}}{2} \langle 1|2 \rangle + 2 \langle 2|1 \rangle - \langle 2|3 \rangle$$
$$= -i$$

### **QCE 3.5**

The X operator is given by the matrix

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$$

and we wish to find  $\lambda$ ,  $(a \ b)^T$  such that

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} a \\ b \end{pmatrix} = \lambda \begin{pmatrix} a \\ b \end{pmatrix}.$$

Now

$$\binom{b}{a} = \lambda \binom{a}{b},$$

so  $b = \lambda a$  and  $a = \lambda b$ . If  $\lambda = 1$ , the corresponding eigenvector is  $(1,1)^T$ . If  $\lambda = 0$ , the eigenvector is  $(0,0)^T$ .

## **QCE 3.6**

As the matrix of Y-operator is

$$\begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix},$$

it is evident that its trace is 0.

## **QCE 3.7**

$$\begin{pmatrix} 1 & 0 & 2 \\ 0 & 3 & 4 \\ 1 & 0 & 2 \end{pmatrix} \begin{pmatrix} a \\ b \\ c \end{pmatrix} = \begin{pmatrix} a+2c \\ 3b+4c \\ a+2c \end{pmatrix} = \begin{pmatrix} \lambda a \\ \lambda b \\ \lambda c \end{pmatrix}.$$

Its clear that a=b. Also  $3b+4c=\lambda b$ , which implies  $4c=(\lambda-3)b$ , and  $c=\frac{1}{4}(\lambda-3)b$ . It follows that  $\lambda\in\mathbb{R}$ .

Suppose

$$A = \begin{pmatrix} a_{1,1} & \dots & a_{1,n} \\ \vdots & \ddots & \vdots \\ a_{n,1} & \dots & a_{n,n} \end{pmatrix}, B = \begin{pmatrix} b_{1,1} & \dots & b_{1,n} \\ \vdots & \ddots & \vdots \\ b_{n,1} & \dots & b_{n,n} \end{pmatrix}.$$

Now, it is easy to see that

$$Tr(A+B) = (a_{1,1} + b_{1,1}) + \dots + (a_{n,n} + b_{n,n})$$
  
=  $(a_{1,1} + \dots + a_{n,n}) + (b_{1,1} + \dots + b_{n,n})$   
=  $Tr(A) + Tr(B)$ .

Also

$$Tr(\lambda A) = \lambda a_{1,1} + \dots + \lambda a_{n,n}$$
  
=  $\lambda Tr(A)$ .

Also-also

$$Tr(AB) = a_{1,1}b_{1,1} + \dots + a_{n,n}b_{n,n}$$
  
=  $b_{1,1}a_{1,1} + \dots + b_{n,n}a_{n,n}$   
=  $Tr(BA)$ ,

as real multiplication commutes.

### **QCE 3.9**

$$P_{+} = \frac{1}{2}(|0\rangle\langle 0| + |0\rangle\langle 1| + |1\rangle\langle 0| + |1\rangle\langle 1|).$$

$$P_{-} = \frac{1}{2}(|0\rangle\langle 0| - |0\rangle\langle 1| - |1\rangle\langle 0| + |1\rangle\langle 1|).$$

Now

$$P_{+} - P_{-} = |0\rangle \langle 1| + |1\rangle \langle 0| = X.$$

## **QCE 3.10**

We have

$$P_{0} = |0\rangle \langle 0| = \begin{pmatrix} 1\\0\\0 \end{pmatrix} (1\ 0\ 0) = \begin{pmatrix} 1&0&0\\0&0&0\\0&0&0 \end{pmatrix},$$

$$P_{1} = |1\rangle \langle 1| = \begin{pmatrix} 0\\1\\0 \end{pmatrix} (0\ 1\ 0) = \begin{pmatrix} 0&0&0\\0&1&0\\0&0&0 \end{pmatrix},$$

$$P_2 = |2\rangle \langle 2| = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}.$$

Now

$$Pr(0) = |P_0|\psi\rangle|^2 = \begin{vmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \\ -\frac{i}{\sqrt{2}} \end{pmatrix} \begin{vmatrix}^2 \\ = \begin{vmatrix} \begin{pmatrix} \frac{1}{2} \\ 0 \\ 0 \end{pmatrix} \end{vmatrix}^2 = \begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \end{pmatrix}^2 = \frac{1}{4},$$

$$Pr(1) = |P_1|\psi\rangle|^2 = \begin{vmatrix} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \\ -\frac{i}{\sqrt{2}} \end{pmatrix} \begin{vmatrix}^2 \\ = \begin{vmatrix} \begin{pmatrix} 0 \\ \frac{1}{2} \\ 0 \end{pmatrix} \end{vmatrix}^2 = \begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \end{pmatrix}^2 = \frac{1}{4},$$

$$Pr(2) = |P_2|\psi\rangle|^2 = \begin{vmatrix} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \\ -\frac{i}{\sqrt{2}} \end{pmatrix} \begin{vmatrix}^2 \\ = \begin{vmatrix} \begin{pmatrix} 0 \\ 0 \\ -\frac{i}{\sqrt{2}} \end{pmatrix} \end{vmatrix}^2 = \begin{pmatrix} \frac{1}{\sqrt{2}} \end{pmatrix}^2 = \frac{1}{2}.$$

#### QCE 3.11

The matrix representations of the Pauli operators are

$$\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1. \end{pmatrix}$$

$$\mathbf{0.1} \quad [\sigma_2, \sigma_3] = 2i\sigma_1$$

$$\sigma_2 \sigma_3 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} = \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix},$$

$$\sigma_3 \sigma_2 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} = \begin{pmatrix} 0 & -i \\ -i & 0 \end{pmatrix}.$$

Now the commutator is

$$[\sigma_2, \sigma_3] = \sigma_2 \sigma_3 - \sigma_3 \sigma_2 = \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix} - \begin{pmatrix} 0 & -i \\ -i & 0 \end{pmatrix} = \begin{pmatrix} 0 & 2i \\ 2i & 0 \end{pmatrix} = 2i\sigma_1.$$

$$\mathbf{0.2} \quad [\sigma_3, \sigma_1] = 2i\sigma_2$$

$$\sigma_3 \sigma_1 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix},$$

$$\sigma_1 \sigma_3 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}.$$

Now the commutator is

$$[\sigma_3, \sigma_1] = \sigma_3 \sigma_1 - \sigma_1 \sigma_3 = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} - \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 2 \\ -2 & 0 \end{pmatrix} = 2i\sigma 2.$$

We need to show that if  $i \neq j$ , then  $\{\sigma_i, \sigma_j\} = 0$ . First of all,  $\{\sigma_i, \sigma_j\} = \sigma_i \sigma_j + \sigma_j \sigma_i$ . By the definition of anticommutator we have that

$$\{\sigma_i, \sigma_j\} = \sigma_i \sigma_j + \sigma_j \sigma_i = \sigma_j \sigma_i + \sigma_i \sigma_j = \{\sigma_j, \sigma_i\},$$

because the real + commutes. Now we don't need to compute all permutations of Pauli operators, but only combinations will suffice, so we need to calculate

- $\{\sigma_1, \sigma_2\},$
- $\{\sigma_1, \sigma_3\},$
- $\{\sigma_2, \sigma_3\}$ .

So

$$\{\sigma_1, \sigma_2\} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} + \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \\
= \begin{pmatrix} i & 0 \\ 0 & -i \end{pmatrix} + \begin{pmatrix} -i & 0 \\ 0 & i \end{pmatrix} \\
= 0.$$

$$\begin{aligned}
\{\sigma_1, \sigma_3\} &= \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} + \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \\
&= \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \\
&= 0.
\end{aligned}$$

The last, but not least

$$\begin{aligned}
\{\sigma_2, \sigma_3\} &= \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} + \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \\
&= \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix} + \begin{pmatrix} 0 & -i \\ -i & 0 \end{pmatrix} \\
&= 0.
\end{aligned}$$

## QCE 4.1

The basis for H is

$$|w_1\rangle = |0\rangle \otimes |0\rangle ,$$
  

$$|w_2\rangle = |0\rangle \otimes |1\rangle ,$$
  

$$|w_3\rangle = |1\rangle \otimes |0\rangle ,$$
  

$$|w_4\rangle = |1\rangle \otimes |1\rangle .$$

First we show that  $|w_i\rangle$  has unit length:

$$\langle w_1 | w_1 \rangle = (\langle 0 | \otimes \langle 0 |) (| 0 \rangle \otimes | 0 \rangle)$$

$$= \langle 0 | 0 \rangle \langle 0 | 0 \rangle$$

$$= 1 \times 1$$

$$= 1.$$

$$\langle w_2 | w_2 \rangle = (\langle 0 | \otimes \langle 1 |) (| 0 \rangle \otimes | 1 \rangle)$$

$$= \langle 0 | 0 \rangle \langle 1 | 1 \rangle$$

$$= 1 \times 1$$

$$= 1.$$

$$\langle w_3 | w_3 \rangle = (\langle 1 | \otimes \langle 0 |) (| 1 \rangle \otimes | 0 \rangle)$$

$$= \langle 1 | 1 \rangle \langle 0 | 0 \rangle$$

$$= 1 \times 1$$

$$= 1.$$

$$\langle w_4 | w_4 \rangle = (\langle 1 | \otimes \langle 1 |) (| 1 \rangle \otimes | 1 \rangle)$$

$$= \langle 1 | 1 \rangle \langle 1 | 1 \rangle$$

$$= 1 \times 1$$

$$= 1.$$

Next we need to check the orthogonality of  $|w_i\rangle$ :

$$\langle w_1 | w_2 \rangle = (\langle 0 | \otimes \langle 0 |)(|0 \rangle \otimes |1 \rangle)$$

$$= \langle 0 | 0 \rangle \langle 0 | 1 \rangle$$

$$= 1 \times 0$$

$$= 0,$$

$$\langle w_1 | w_3 \rangle = (\langle 0 | \otimes \langle 0 |)(|1 \rangle \otimes |0 \rangle)$$

$$= \langle 0 | 1 \rangle \langle 0 | 0 \rangle$$

$$= 0 \times 1$$

$$= 0,$$

$$\langle w_1 | w_4 \rangle = (\langle 0 | \otimes \langle 0 |)(|1 \rangle \otimes |1 \rangle)$$

$$= \langle 0 | 1 \rangle \langle 0 | 1 \rangle$$

$$= 0 \times 0$$

$$= 0,$$

$$\langle w_2 | w_3 \rangle = (\langle 0 | \otimes \langle 1 |)(|1 \rangle \otimes |0 \rangle)$$

$$= \langle 0 | 1 \rangle \langle 1 | 0 \rangle$$

$$= 0 \times 0$$

$$= 0,$$

$$\langle w_2 | w_4 \rangle = (\langle 0 | \otimes \langle 1 |)(|1 \rangle \otimes |1 \rangle)$$

$$= \langle 0 | 1 \rangle \langle 1 | 1 \rangle$$

$$= 0 \times 1$$

$$= 0,$$

$$\langle w_3 | w_4 \rangle = (\langle 1 | \otimes \langle 0 |)(|1 \rangle \otimes |1 \rangle)$$

$$= \langle 1 | 1 \rangle \langle 0 | 1 \rangle$$

$$= 1 \times 0$$

$$= 0.$$

Now we see that  $\{w_1, w_2, w_3, w_4\}$  is a orthonormal basis.

## **QCE 4.3**

$$\langle a|b\rangle=1/2,\ \langle c|d\rangle=3/4.$$

$$\begin{split} \langle \psi | \phi \rangle &= \langle |a\rangle \otimes |c\rangle \, | \, |b\rangle \otimes |d\rangle \rangle \\ &= (\langle a| \otimes \langle c|) (|b\rangle \otimes |d\rangle) \\ &= \langle a|b\rangle \, \langle c|d\rangle \\ &= \frac{1}{2} \times \frac{3}{4} \\ &= \frac{3}{8}. \end{split}$$

## **QCE 4.4**

$$|\psi\rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \quad |\phi\rangle = \frac{1}{2} \begin{pmatrix} 1 \\ \sqrt{3} \end{pmatrix}.$$

Now the tensor product  $\psi \otimes \phi$  is

$$\begin{split} \left(\frac{1}{\sqrt{2}}\left|0\right\rangle + \frac{1}{\sqrt{2}}\left|1\right\rangle\right) \otimes \left(\frac{1}{2}\left|0\right\rangle + \frac{\sqrt{3}}{2}\left|1\right\rangle\right) &= \left(\frac{\frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}}}\right) \otimes \left(\frac{\frac{1}{2}}{\frac{\sqrt{3}}{2}}\right) \\ &= \left(\frac{\frac{1}{2\sqrt{2}}}{\frac{\sqrt{3}}{2\sqrt{2}}}\right) \\ &= \frac{1}{2\sqrt{2}}\left|0\right\rangle\left|0\right\rangle + \frac{\sqrt{3}}{2\sqrt{2}}\left|0\right\rangle\left|1\right\rangle + \frac{1}{2\sqrt{2}}\left|1\right\rangle\left|0\right\rangle + \frac{\sqrt{3}}{2\sqrt{2}}\left|1\right\rangle\left|1\right\rangle. \end{split}$$

### QCE 4.5

$$|\psi\rangle = \frac{1}{2}(|0\rangle |0\rangle - |0\rangle |1\rangle - |1\rangle |0\rangle + |1\rangle |1\rangle)$$
$$= \frac{|0\rangle - |1\rangle}{\sqrt{2}} \otimes \frac{|0\rangle - |1\rangle}{\sqrt{2}}.$$

## **QCE 4.6**

$$\begin{split} |\psi\rangle &= \frac{|0\rangle\,|0\rangle + |1\rangle\,|1\rangle}{\sqrt{2}} \\ &= \left(\alpha\,|0\rangle + \beta\,|1\rangle\,\right) \otimes \left(\gamma\,|0\rangle + \delta\,|1\rangle\,\right) \\ &= \alpha\gamma\,|0\rangle\,|0\rangle + \alpha\delta\,|0\rangle\,|1\rangle + \beta\gamma\,|1\rangle\,|0\rangle + \beta\delta\,|1\rangle\,|1\rangle\,. \end{split}$$

Now we have

$$\begin{split} \alpha \gamma &= \beta \delta \\ &= \frac{1}{\sqrt{2}}, \\ \alpha \delta &= \beta \gamma \\ &= 0. \end{split}$$

Obviously, either  $\alpha=0$  and/or  $\delta=0$ . In any case, either  $\alpha\gamma=0$  and/or  $\beta\delta=0$ , when they should be non-zero, so it is not possible to write  $|\psi\rangle$  as a product state.
